HISTOPATHOLOGICAL EXAMINATION (XL)

LAB ID: HP 4432/25

CLINICAL DATA AND DIAGNOSIS

Carcinoma right ovary stage III
Uterus with cervix, BSO and omentum for HPE

GROSS DESCRIPTION

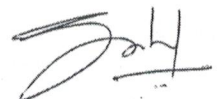

Uterus with cervix measures 10 x 7 x 5 cm. Cut section shows trabeculated myometrium. ET 2 mm. Attached left ovary measures 3 x 2 x 1 cm and fallopian tube measures 3 cm. Separately received right ovary is nodularly enlarged measuring 17.5 x 13.5 x 4.5 cm and attached fallopian tube measures 8 cm. The capsule appears intact. Cut surface identified predominantly a solid grey white tumor showing a variegated morphology with areas of necrosis and hemorrhage. Small cystic areas also seen. Separately received piece of omentum measuring 24 x 10 x 1 cm. No lymph nodes or tumor deposits identified.

Sections :

A : Endometrium, B : Cervix, C : Left ovary and tube , D : Left parametrium, E : Right parametrium, F - K right ovary with fallopian tube, L, M : Omentum

MICROSCOPIC EXAMINATION

Sections from right ovary shows an infiltrating neoplasm arranged as papillary, glandular and solid architecture composed of cells with scant cytoplasm, highly pleomorphic vesicular nucleus with prominent nucleoli. Increase in mitosis seen. Areas of necrosis noted. Sections from cyst shows multiple papillae lined by multi layer of these atypical cells. Capsule infiltration is not seen. The attached fallopian tube not infiltrated by the tumor. Sections show cervix showing chronic inflammatory cell infiltration. The endometrium shows mildly dilated and tortuous glands lined by single layer of columnar cells and surrounded by spindle celled

stroma. The myometrium shows multiple islands of endometrial glands and stroma. Sections from left ovary and fallopian tubes are histologically unremarkable. Sections from bilateral parametrium are free of tumor. Sections from omentum histologically unremarkable. No atypia seen.

IMPRESSION

CASE SUMMARY :

SPECIMEN

Procedure : Total hysterectomy and bilateral salpingo-oophorectomy
Specimen Integrity : Capsule intact

TUMOR

Tumor Site : Right ovary
Tumor Size : 17.5 x 13.5 x 4.5 cm.
Histologic Type : Features are suggestive of High-grade serous carcinoma
Ovarian Surface Involvement ; Not identified
Fallopian Tube Surface Involvement : Not identified
Other Tissue / Organ Involvement : Bilateral Fallopian tubes, bilateral parametrium and left ovary not involved by tumor
Omentum : Not involved by tumor

pTNM CLASSIFICATION (AJCC 8th Edition) : pT1a

Advised immunohistochemical studies of p53, WT1, Vimentin, CTNNB1 to rule out the possibility of endometrial carcinoma.
